

DRIP EDGE AND FASCIA SYSTEM

Abstract

A drip edge and fascia system according to the invention comprises a drip edge adapted to be nailed to the roof, and a fascia cover mounting bracket adapted to be nailed to an adjacent fascia board. A fascia cover is snap fit to the fascia cover mounting bracket, but remains slidable relative to the fascia cover mounting bracket so that it will not buckle with temperature changes. All components can be formed of the same material as conventional siding, e.g., extruded vinyl with matching color.
